

Installation 0-10V set GA5906

Function: This wire set is a tool to make a 0-10V control of Winterwarm heaters possible. It enables an 0-10 V signal input from any sort of low power supplying device.

It fits all appliances with the Argus 966 burner control as from december 2020.

Attention: When a 0-10V input has been implemented; use no other inputs. This will lead to an unreliable system.

Figuur 1. Content GA5906

Installation:

1. Disconnect plug J9 of the control board but leave it intact for later use
2. Insert the plug of the new cable into J9
3. Mount the white terminal somewhere on the terminal support or else.
4. Attach the sticker underneath

Your 0-10V input is now ready.

A 0-10V signal isolator is strongly recommended!
